

Years ago PYLE-NATIONAL decided to cut costs by eliminating the etched metal tag that indicated the part number of the connector. Some connectors had the part numbers marked in ink, some have a self-stick label applied with the part number and other connectors were not marked at all. Obviously this can create a problem for someone else who needs to replace or obtain additional connectors. Here is a guide to help you figure the part number. Since the majority of replacements are for plugs I am only concentrating on how to identify plugs in this memo. For receptacles and other items not covered in this memo please forward a photo of your connector to the email below so we can identify it for you.

WARNING: Before performing the next step make sure no power is going to the plug.

To determine the first letter of the part number you need to know if the ground contact is grounded to the shell of the plug. Take one lead of an Ohm meter and hold it to the plug shell and then take the other lead and touch each contact. If you get a reading then your contact is grounded to the shell so start your part number with the letters

JP for grounded or **KP** for ungrounded. If the plug has a coupling nut add the letter **L**.

Next add the letter **D**.

Here is an example of a plug that has forge markings. We get a lot of calls from people thinking that this is the part number of the plug. Compare the number you have on your plug to the chart below and add the dash number to your part number.

FORGE #	DASH #
JP-3046-YX	-530
JP-3046-ZX	-830
JP-6036-TX	-860
JP-6036-YX	-1160
JP-6036-ZX	-14104
JP-10036-YX	-11100
JP-10036-ZX	-14100

ASSEMBLE THE PART NUMBER HERE

If you have 3 contacts add the number **36** to your part number or **46** if you have 4 contacts.

Add **-PR** to your part number if you want pressure contacts.

Example...

KPLD-86036 Ungrounded plug, with coupling nut, JP-6036-TX forge markings and 3 solder contacts.

JPD-1110046-PR Grounded to shell plug with JP-10036-YX forge markings and 4 pressure contacts.
